Sample scanning principle

EP 100 + Offline Burr height measurement system

- Thickness range 0,05 – 5 mm (other ranges must be clarified)
- Width range 10 – 1000 mm (other ranges must be clarified)
- Strip sample length > 200 mm (recommended strip length 1200 mm)
- Strip feeding speed 5 – 75 mm/s (adjustable via potentiometer)
- Measuring accuracy $\pm 1 \mu\text{m}$
- Burr height detection range 2 – 600 μm (Related to surface roughness)
- Measurement resolution Z-axis 0,11 μm
- Optical profile length X-axis CD 4,3 mm
- Pixel size X 2,10 μm

Setup and main measurement screen

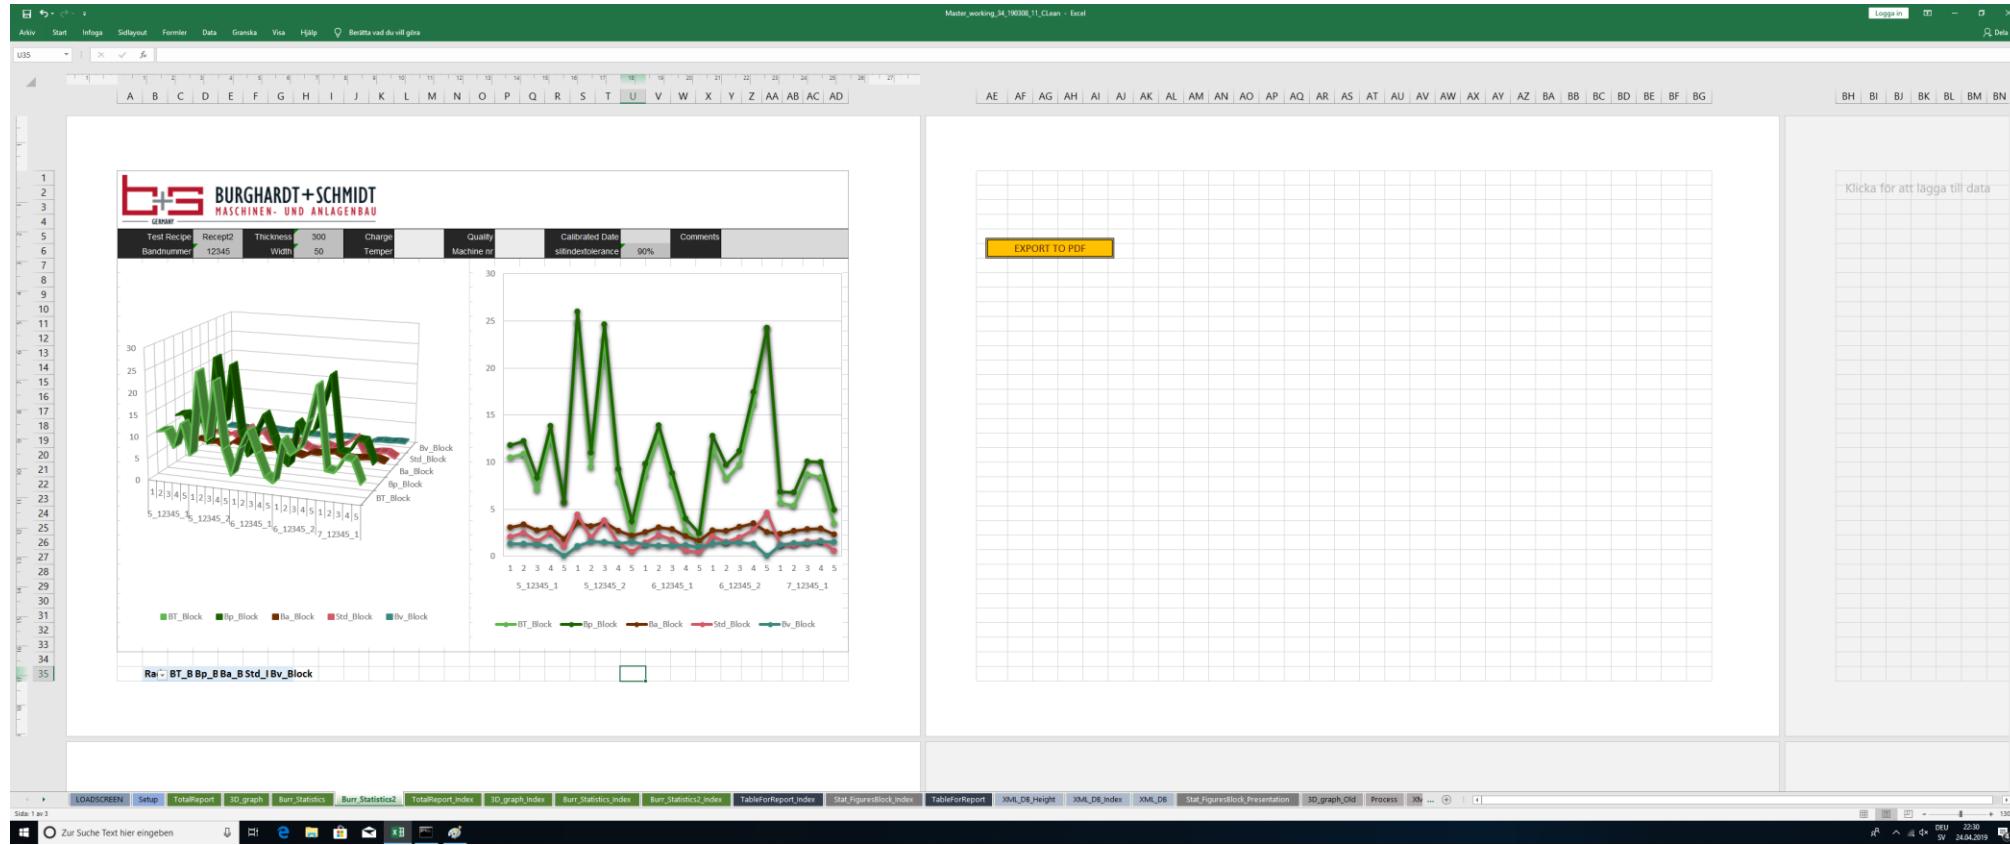

Total report of all measurements under one coil number

3-D chart for comparative measurements under one coil number

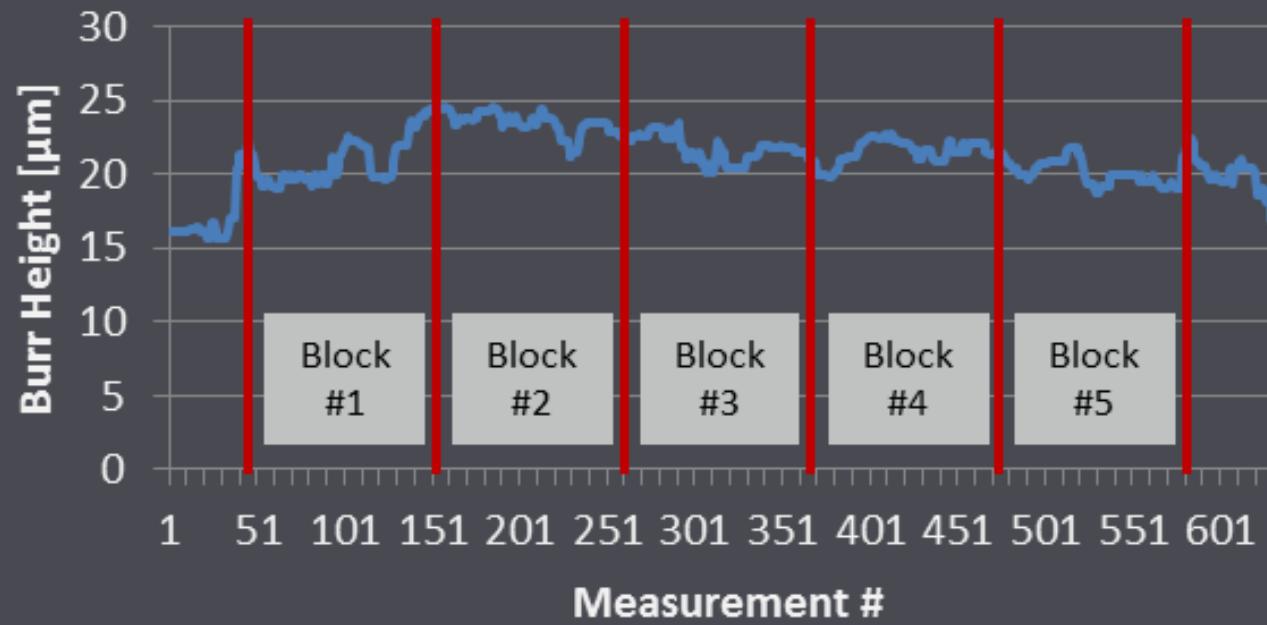

Burr statistics; Ba, Bp, Bv and Bt under one coil number

Burr statistical calculation with results for each 5 blocks

Readings

$$Ba_{block} = \frac{1}{n} \sum_{i=1}^n y_i \quad | \quad Ba = \frac{1}{blocks} \sum_{i=1}^{blocks} Ba_i \quad | \quad blocks = 5$$

Ba – average of Burr Height values.

$$Bv_{block} = \min y_i \quad | \quad Bv = \frac{1}{blocks} \sum_{i=1}^{blocks} Bv_i \quad | \quad blocks = 5$$

Bv – average of Burr Height minima.

$$Bt_{block} = \max y_i - \min y_i \quad | \quad Bt = \frac{1}{blocks} \sum_{i=1}^{blocks} Bt_i \quad | \quad blocks = 5$$

Bt – average of Burr Height maxima - minima.

$$Bp_{block} = \max y_i \quad | \quad Bp = \frac{1}{blocks} \sum_{i=1}^{blocks} Bp_i \quad | \quad blocks = 5$$

Bp – average of Burr Height maxima.

Statistical calculation method
